Mean 27.267; Variance 32.331; scale 0.843

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Tabular output not generated.

Title: >US-08-991-628-5
Description: (1-15) from US08991628.pep
Perfect Score: 113

Sequence: 1 CECNIKVKDVNDNFP 15

Scoring table: PAM 150 Gap 15

Searched: 170751 seqs, 21266608 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq35 1:part1 2

1:part1 2:part2 3:part3 4:part4 5:part5 6:part6 7:part7 8:part8 9:part9 10:part10 11:part11 12:part12 13:part13 14:part14 15:part15 16:part16 17:part17 18:part18 19:part19 20:part20 21:part21 22:part22 23:part23 24:part24 25:part25 26:part26 27:part27 28:part28 29:part29 30:part30 31:part31 32:part32 33:part33 34:part34 35:part35 36:part36 37:part37 38:part38 39:part39

Statistics: Mean 18.398; Variance 59.622; scale 0.309

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

auto-immune disease Claim 1; Page 40; 58pp; English. Chaim 1; Page 40; 58pp; English. Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the

                                                                                                                                        Fused protein recognised by pemphigus vulgaris auto:antibody useful to treat and diagnose pemphis vulgaris Claim 1; Page 7-9; 9pp; Japanese.

W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients wit pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgGl hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; 50pp; English. This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amagai M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pemphigus foliaceus antigen-IgG constant region fusion protein - linked through the hinge region used to treat pemphigus foliaceus Claim 1; Page 10:12; 17pp; Japanese.

This sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus is antigen protein through the hinge portion. Pemphigus foliaceus is antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is especially administered through an adsorbent upon which the fusion protein is immunobilised via a carrier. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful immunodiagnosis. The fusion protein has little or no side effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                             FIT Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion
PS Claim 1; Column 69-72; 56pp; English.

CC This sequence represents human cadherin-5. The invention specifically
CC provides details of human cadherin-5, -8, -11, -12 and -13, and rat
CC cadherin-8, -5, -11 and -13. Cadherin are calcium-dependent cell
CC adhesion proteins. They are glycosylated integral membrane proteins
CC that have an N-terminal extracellular domain that determines binding
CC specificity, a hydrophobic membrane spanning region and a C-terminal
CC cytoplasmic domain, which is highly conserved among members of the
CC through eatenins and other cytoskeleton-associated proteins. The
CC cudherins in various cancers. Sequence analysis of the role of
CC cadherins also allows investigation of the structure and function of
CC cadherin. The cadherin proteins may be used to modulate the activity
CC anthodies. These antibodies may also be used to modulate the activity
CC featherin and to determine the tissue specific distribution of cadherin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C-terminal cytoplasmic domain. The cytoplasmic domain interacts with the cytoplasmic domain is and other cytoskeleton associated proteins. The cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These sequences were isolated using primers 1 and 2 (see T03575 and T03576) The proteins may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protecacherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17-APR-1992;

The present sequence is used to demonstrate the method of the invention. The specification describes the comparison of DNA base sequences. The method involves 3 steps of: (1) division of a first and second nucleic acid sequence into base groups of three base lengths, and translation into amino acids; (2) all base and amino acid insertions and deletions of the two nucleic acid sequences are observed and the amino acid sequences encoded by these nucleic acid sequences are compared; and (3) adjacent bases and amino acids are compared and step (1) repeated after shifting the translation frame by one base towards the 3' end or shifting the translation frame one base towards the 3' end, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      on homologous rat cadherin cDNA.
Antibodies or fragments that specifically bind the human can be used to purify the cadherin, determine its tissue and antagonise its ligand/antiligand binding activities.

                                                                                                                                                                                                                                                                                                                                                                                      pri plagnosing presence of abnormal epithelial tissue in vitro - respectively. The provided of alpha beta 4 cell surface protein strangle 5; Figure 9; 34pp; English.

Example 5; Figure 9; 34pp; English.

Integrins are heterodimers comrised of alpha and beta subunits, that are non-covalently associated transmembrane glycoproteins. Il alpha chains and 6 beta chains have been recognised in man. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions. Integrins mediate (in part) the interaction of cells with the extracellular matrix, forming a link between the extracellular matrix and the cytoskeleton. They may transmit signals from the extracellular to the intracellular environment, affecting cell behaviour. This sequence is the beta4 subunit of an alpha6 beta4 integrin.
                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC C-terminus of the fourth extracellular subdomain (EC-4) were CC identified. The corresp degenerate oligos (068949, 068950) were CC designed for use as PCR primers PCR was carried out on a rat brain CC DNA prepn. Two major bands of about 450 bps and 130 bps were found. The 450 bp band corresponded to the expected length between the two CC primer sites, but the 130 bp band could not be predicted from any CC of the previously identified cadherin sequences. The 450 bp and 130 cC bp bands were extracted and sequenced. Nineteen novel partial cDNA CC clones were isolated. The DNA and deduced AA sequences of the CC clones (including sequences corresp. to the PCR primers) are given in 068951-068969 and R58860-R58878. The deduced AA sequences of the CC cDNA clones are homologous to, but distinct from the known cadherins. The cadherins described thus far have highly conserved CC chas sequences in the EC-3 including the consensus sequence CC corresp. sequence in R58879 or R58880 at its end, while the CC corresp. sequences of other subdomains, except for the 5th extra-cc cellular subdomain (EC-5), are D-R-E and the sequence in R58881 creatively. In contrast the deduced AA sequences of the CC clones that corresp. to cadherin extracellular subdomains include creatively identified cadherin extracellular subdomains include corresp. To sepectively identified cadherins but did not show significant the converse of the partial clones are homologous to converse and the sequence of the previously identified cadherins but did not show significant the converse of the partial clones are homologous to converse and converse of the partial clones are homologous to converse and converse of conver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

CC and T03576. The primers were constructed from portions of the amino acid conditions of the third and fourth extracellular domains of published cc cadherin sequences. The full length cDNA sequence encoding rat cc protocadherin pc5 is represented in T03574. The cytoplasmic domain of cc cadherin interacts with the cytoskeleton through cattenins and other cytoskeleton associated proteins. The cytoplasmic domain is not present cd in all cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in cc cell adhesion. These sequences may have regulatory functions in the ccll cell as well as the cell-cell adhesive properties. Antibodies produced cc against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
PT Helicobacter pylori nucleic acid sequences and encoded PT polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection PS Claims 14,94; Page 677-678; 1145pp; English.

CC This sequence is a H. pylori secreted protein.

CC This sequence is a H. pylori secreted protein.

14-MAY-1997 (first entry)
Human cadherin-Lantigenic epitope (residues 242-252).
Ca2+ dependent; cell adhesion protein; cadherin; human; antibody; purification; determination; epitope; tissue expression; binding antagonist; calcium ion; antigen.

                                                                                                                                                           Pri Helicobacter pylori nucleic acid sequences and encoded pri Helicobacter pylori nucleic acid sequences to treat or prevent H. pylori priestion and for diagnosis of H. pylori infection for diagnosis of H. pylori infection for diagnosis of H. pylori infection for treat H. pylori protein may be used in a vaccine to prevent or treat H. pylori protein may be used in a vaccine to prevent or treat H. pylori confection for to identify H. pylori polypeptide binding compounds, for useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of CC acid sequences complementary to the DNA act as antisense sequences and CC can be used to prevent the translation of H. pylori infection. Nucleic can be used to prevent the translation of H. pylori mRNA. Antibodies CC against the protein can be used in immunoassays to evaluate the abundance CC and distribution of H. pylori-specific antigens. The genomic sequence of CC H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF cere analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR constrained the sequences of interest, particular regions can be isolated from H. pylori by PCR constrained the sequences of interest, particular regions can be isolated from H. pylori by PCR constrained the sequences of interest, particular regions can be isolated from H. pylori by PCR constrained the sequences of interest, particular regions can be isolated from H. pylori by PCR constrained the sequences of interest particular regions can be solated from H. pylori by PCR constrained 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

Claim 5; Column 112; 59pp; English.

The present sequence is an antigenic epitope from human cadherin-5, which is a Ca2+ dependent cell adhesion protein. Antibodies or fragments that specifically bind the epitope can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

Sequence 11 AA;

                                                                                                                           petection of t(1,19) break-point-associated genes E2A and pr1 in chromosomal translocation, and prods. useful in diagnosis and therapy of human neoplasm, esp. acute lymphoblastic leukaemia pisclosure; Fig 1D; 104pp; English.

The E2A gene (see Q13659), encoding immunoglobulin enhancer-binding factors E12 and E47 (see Q13670 and Q13671), is localised to the breakpoint of a consistently recurring chromosomal translocation t(1:19) chromosomal translocations. The translocation results in synthesis of a fusion mRNA (see Q13672 for fusion cDNA) that crosses the breakpoint between chromosome 1 and 19.

The CDNAs of E12 and E47 encode nearly identical proteins contg. a region that appears to represent a novel helix-loop-helix DNA-binding and dimerisation motif. The motif shares significant homology with domains in several proteins involved in the control of differentiation and proliferation in various cellular lineages. See also Q1369-75.

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Complete sequence of the desmoglein precursor and evidence for the existence of different desmoglein genes expressed in cell type-specific patterns.
                                                                                                                                                                                                                                                    Koch, P.J.; Walsh, M.J.; Schmelz, M.; Goldschmidt, M.D.; Zimbelmann, R.; Franke, W.W.
Eur. J. Cell Biol. (1990) 53:1-12
Identification of desmoglein, a constitutive desmosomal glycoprotein, as a member of the cadherin family of cell adhesion molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            submitted to the EMBL Data Library, February 1991 838721

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:36:11 1999; MasPar time 2.45 Seconds 172.800 Million cell updates/sec

Tabular output not generated.

Title: Description: Perfect Score: >US-08-991-628-5 (1-15) from US08991628.pep 113

Sequence: 1 CECNIKVKDVNDNFP 15

Scoring table: РАМ 150 Gap 15

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Mean 26.658;

Variance 31.710;

scale 0.841

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NATL. ACAD. SCI. U.S.A. 88:4796-4800(1991).

FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS.

INVOLVED IN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEDIFILAMENTS MEDIATING CELL-CELL ADHESION.

FILAMENTS MEDIATING CELL-CELL ADHESION.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: EPIDERMIS, TONGUE, TONSILAND OESOPHAGUS.

DOMAIN: CALCIUM MAY BE BOUND BY THE CADHERIN-LIKE REPEATS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (POTENTIAL).
